China Coal International Solar Power Generation Project

**PV / DG
Application**

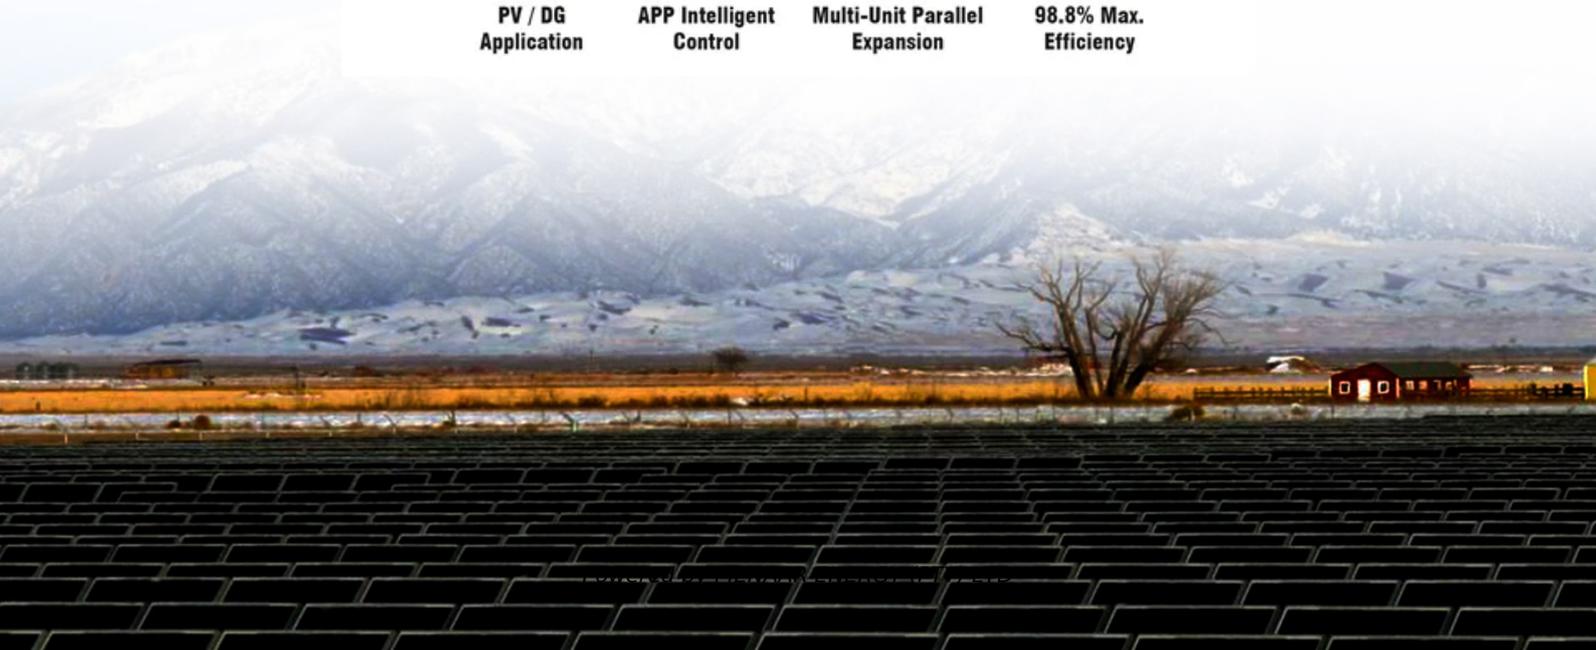

**APP Intelligent
Control**

**Multi-Unit Parallel
Expansion**

**98.8% Max.
Efficiency**

Overview

This year China will see its solar capacity outstrip its coal capacity for the first time, according to an industry group. Coal power capacity additions reached their highest level in a decade, even as coal power generation declined, and clean energy met all net growth in power demand. Rapid growth in energy storage further eased system constraints. More than 50 large coal units were commissioned in 2025, up from fewer than 20 a year over the previous decade. Even as China's expansion of solar and wind power raced ahead in 2025, the Asian giant opened many more coal power plants than it had in recent years - raising concern about whether the. China is expanding coal power despite record renewable investments to meet energy needs and ensure energy security after 2022's shortages. In its latest projections, the China Electricity Council says that, by the end of 2026, wind and solar will account for nearly half of China's power capacity.
