## Overview

---

Flow batteries are innovative systems that use liquid electrolytes stored in external tanks to store and supply energy. They're highly flexible and scalable, making them ideal for large-scale needs like grid support and renewable energy integration. You can increase capacity by adding more. Demand from AI data centers alone is projected to increase 165% by 2030 and electricity grids around the world will need to deploy 8 TW of long-duration energy storage (LDES) by 2040 to meet clean energy targets. As demands on the grid continue to grow, LDES will keep the lights on. ESS solutions. Next-level energy storage systems are beginning to supplement the familiar lithium-ion battery arrays, providing more space to store wind and solar energy for longer periods of time, and consequently making less room for fossil energy in the nation's power generation profile. The California flow. The design provides a pathway to a safe, economical, water-based, flow battery made with Earth-abundant materials. But while the benefits of BESS are well established, the type of battery that should sit at the heart of. Flow batteries store their energy in separate electrolytes, that circulate through electrochemical cells where they exchange ions across membranes. There is growing interest in using flow.
