# Generators generate electricity and transmit it to substations

## Overview

---

Energy transmission is the process by which electricity is transported from generation sites, such as power plants, to substations located closer to consumers. The electricity supply chain consists of three primary segments: generation, where electricity is produced; transmission, which moves power over long distances via high-voltage power lines; and distribution, which moves power over shorter distances to end users (homes, businesses, industrial sites). In a less simple way, substation is the key part of electrical generation, transmission, and distribution systems. Substation transforms voltage from high to low or from low to high as necessary.
