Inlet and exhaust area of generator room

Overview

Air intake and exhaust systems: NFPA 37 requires that intake and exhaust openings be positioned to prevent the re-entrainment of hot gases or combustion byproducts. Intakes must be clean, filtered, and located away from exhaust discharge. Ventilation is typically done through the use of an air inlet, air outlet/exhaust fan, and/or other ventilation openings. When ever possible, face the generator. Like ICE-powered automobiles, ICE electrical generator systems have radiators and exhaust systems that reject heat. Here's why careful consideration matters. Ensures Safety A well-designed room accounts for spill containment, fire-rated construction, and proper separation between ignition sources and fuel.
