Introduction to Lithium-Ion Energy Storage Systems

Overview

Lithium-ion batteries, which are used in mobile phones and electric cars, are currently the dominant storage technology for large scale plants to help electricity grids ensure a reliable supply of renewable energy. Battery Energy Storage Systems (BESS) are enabling the U. power grid to transform as intermittent energy sources like wind and solar have increased which requires other power sources to become more dispatchable and flexible. While many discussions focus solely on backup power applications, lithium ion BESS offer far more versatility—from short-term energy storage for grid balancing to. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.
