Is it possible to balance a lithium battery pack when it is fully charged

Overview

Batteries that are out of balance cannot be fully charged or fully discharged, and the imbalance causes cells to wear and degrade at accelerated rates. Cell differences arise during both manufacturing and. Battery balancing is the process of equalizing the charge across individual cells in a battery or individual batteries in battery groups to ensure uniform voltage levels, or state of charge (SOC). This is because the voltage difference is what allows current to flow. So, as the voltage of the cell group gets closer and closer to the charger's target. The means used to perform cell balancing typically include by-passing some of the cells during charge (and sometimes during discharge) by connecting external loads parallel to the cells through controlling corresponding FETs.

Is it possible to balance a lithium battery pack when it is fully charged

How To Balance A Lithium Batteries: Top and Bottom Balancing

What Is Lithium-Ion Cell Balancing?How to Balance Lithium BatteriesWhat Is Top Balancing?What Is Bottom Balancing?How to Bottom Balance A Lithium Battery PackHow to Top Balance A Lithium Battery PackThere are several ways this can be achieved. Batteries can be top-balanced or bottom-balanced. They can be actively balanced or passively balanced. The quickest way to balance cells is by burning off the excess energy. For example, if all of your cell groups but one are at 4.05 volts and the high cell group is at 4.2 volts, it will be much quicker See more on cellsaviors
