Lightning protection and grounding of solar photovoltaic panels

Overview

Lightning protection systems (LPS) provide a protective zone to assure against direct strikes to PV systems by utilizing basic principles of air terminals, down conductors, equipotential bonding, separation distances and a low-impedance grounding electrode system. Lightning is a common cause of failures in photovoltaic (PV) and wind-electric systems. But most lightning damage is preventable. While air termination systems capture lightning strikes and down conductors route current safely downward, the grounding system provides the essential. Effective lightning protection systems designed specifically for photovoltaic installations are essential in mitigating these risks. Research shows that extreme. Solar PV systems are designed to collect energy from sunlight, but they also have large metallic components including panels, frames, and mounts, along with extensive electrical wiring. Both metal and wiring serve as excellent paths for electrical currents, making solar installations natural.
