# Mass PV inverter time adjustment

## Overview

---

With growing global solar capacity (expected to reach 2.3 TW by 2025 per IEA), proper inverter timing has become critical for maximizing ROI. This guide targets solar system installers, facility managers, and renewable energy enthusiasts seeking photovoltaic inverter time adjustment. National Grid is experiencing record amounts of solar PV deployment within its service territories, creating an opportunity to operate a cleaner electric grid and help achieve local and national emission reduction goals. Renewable-based DER also brings challenges to the electric transmission and distribution system. This is achieved by the battery inverter changing the AC frequency to signal the PV inverters to curtail their output power. The SMA default frequency shift power control, P (f), is set in the Grid Monitoring section in the EnnexOS or on the inverter. If this parameter is set to Disable, the inverter does not respond to the scheduling instruction from the remote port. When. Adjust your inverter settings to minimize reactive power and achieve a power factor as close to 1 as possible. This reduces energy losses and improves system stability.
