Microgrid construction conditions

Overview

Microgrid construction is a complex process that involves careful planning and design, procurement of equipment and materials, installation, and testing and commissioning. Authorized by Section 40101(d) of the Bipartisan Infrastructure Law (BIL), the Grid Resilience State and Tribal Formula Grants program is designed to strengthen and modernize America's power grid against wildfires, extreme weather, and other natural disasters that are exacerbated by the climate. The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD (AT&L). Sandia National Laboratories is a multimission laboratory managed and operated by National Technology & Engineering Solutions of Sandia, LLC, a wholly owned subsidiary of Honeywell International Inc. Department of Energy's National Nuclear Security Administration under contract. Presentation was intended to build foundational understanding of energy resilience, reliability, and microgrids. Factors such as the availability of energy resources, the geographical layout of the site, and the existing infrastructure must be considered.

Microgrid construction conditions

Microgrid Overview

In terms of microgrid design, this means that the microgrid does not have to be built to serve power 24/7, but instead can be built to provide power during times the main electric grid experiences an outage ...
