Microgrid control operation and black start

Overview

During a blackstart procedure, a microgrid is restored to islanded operation mode after a complete shutdown. The restoration process involves the microgrid central controller (microgrid EMS and microgrid SCADA), multiple resources, loads, and switchgear. A multiple-MG approach is proposed and compared to the existing methods in. Abstract—This paper provides an insight into power system restoration on a small scale, where the distributed generation in microgrids is used to facilitate black-start strategies to provide faster and efficient power restoration. The idea was to employ non-conventional and renewable generation. To mitigate black start failures resulting from energy storage state of charge (SOC) exceeding operational limits, this study develops a restoration strategy incorporating SOC constraints.
