Microgrid participating in black start

Overview

Microgrids typically have black-start capability since multiple generation resources within the microgrid allow the system to restart on its own [26]. Black start is the process of restoring power to part of an electric grid without relying on the external electric power. Abstract—This paper examines state-of-the-art microgrid (MG) black-start technologies with grid-forming (GFM) inverter-based resources (IBRs) and proposes black start and interconnection methods for 100% inverter-based MGs. The idea was to employ non-conventional and renewable generation. The development of a Black Start procedure allows a facility to operate independently of the grid. This paper studies the novel approach with electromagnetic transient (EMT) simulations. Firstly, an adaptive SOC control without bias for energy storage units is proposed to achieve SOC balance.

Microgrid participating in black start

A Black Start Recovery Strategy for a PV-Based Energy Storage Microgrid

To mitigate black start failures resulting from energy storage state of charge (SOC) exceeding operational limits, this study develops a restoration strategy incorporating SOC constraints.
