

Overview

Climate change has significantly affected Northern Cyprus, causing various environmental and health issues. The region has experienced a noticeable warming trend. In 2023, Cyprus accounted for around 0.7 % between 2005 and 2023, while its net carbon removals in the land use, land-use change and. Climate change is predicted to lead to rising temperatures (along with other negative effects of climate change) at a swifter rate in Cyprus than many other areas of the planet. [1] Cyprus is an island nation geographically situated in the Middle East, with low levels of rainfall. The revision project, which began in 2023. The Atmospheric and Climate Research Division has been instrumental in providing evidence that the Eastern Mediterranean and Middle East (EMME) region is a climate change 'hot spot' and relating this to public health, ecosystem development and water, to name but a few of the impact sectors. Cyprus, the picturesque island nation in the Eastern Mediterranean, is not immune to the far-reaching consequences of climate change. The country has long experienced scorching summers, and increasingly extreme periods of hot temperatures pose a significant threat to public health, accompanied by.
