Photovoltaic panels installed in snow

Overview

While snow accumulation poses a temporary physical barrier to sunlight, the physics of photovoltaic (PV) cells actually favor colder temperatures, allowing for peak efficiency during clear winter days. 1 Furthermore, the reflective properties of snow—known as the albedo. If you live in a snowy area and have solar panels—or you're thinking about installing them, you've probably wondered the same thing every winter: Do I need to remove snow from my solar panels?

And if so, what's the easiest way to do it?

The short answer: In most cases, you don't need to do anything. As solar energy becomes a staple of the American residential landscape, adoption is spreading rapidly from the sun-drenched Southwest to the snowy expanses of the Northeast, Midwest, and Rocky Mountains. For a homeowner in Boston, Chicago, or Denver, the prospect of installing solar panels often. Solar panels work in the wintertime and can even be more efficient than in the summer months. This is because, like with many electric devices, solar panels can overheat when it's too hot. When the heat is extreme, this may even cause them to fail and shut down entirely. As a result, panels cannot generate power without light.
