Photovoltaics cannot do without energy storage

Overview

Let's address the elephant in the room - photovoltaic systems don't actually require energy storage to be effective. Many homeowners picture solar panels chained to bulky batteries like some renewable energy ball and chain. Energy and storage technologies is one such case. The reason: Solar energy is not always produced at the time energy is needed most. Peak power usage often occurs on summer afternoons. Sometimes energy storage is co-located with, or placed next to, a solar energy system, and sometimes the storage system stands alone, but in either configuration, it can help more effectively integrate solar into the energy landscape. Inefficiency in storage systems - Current energy storage technologies, such as lithium-ion batteries, exhibit. UChicago's Shirley Meng explains the limitations of lithium-ion batteries and explores better alternatives for long-term energy storage in Knowable Magazine.
