# **Sodium-sulfur battery mechanism cabinet base station**

## Overview

---

This pairing forms the basis of the Sodium-Sulfur (NaS) battery system, engineered specifically for stationary, utility-scale applications where high capacity and long operational life are prioritized over portability. Sodium, the sixth most abundant element on Earth, is an attractive, low-cost material for industrial applications. Due to the high operating. made of molten sodium (Na). The electrodes are separated by a solid ceramic, sodium beta alumina, which also serves as the electrolyte. The battery temperature is kept between 300° C and 350° C to keep the electrodes in a.

### Sodium-sulfur battery

When sodium gives off an electron, the Na<sup>+</sup> ion migrates to the sulfur container. The electron drives an electric current through the molten sodium to the contact, through the electrical load and back to the ...

Overview Operation Construction Safety Development Applications External links

During the discharge phase, molten elemental sodium at the core serves as the anode, meaning that the Na donates electrons to the external circuit. The sodium is separated by a beta-alumina solid electrolyte (BASE) cylinder from the container of molten sulfur, which is fabricated from an inert metal serving as the cathode. The sulfur is absorbed in a carbon sponge. BASE is a good conductor of sodium ions above 250 °C, but a poor conductor of electrons, and thus av...
