

**PIENAAR ENERGY (PTY) LTD**

# **Solar automatic light tracking control system**

## Overview

---

Below is a step-by-step guide to designing such a system: 1. System Overview

The solar automatic light tracking system consists of: Solar Panel: To capture solar energy. Light Sensors: To detect the sun's position. Microcontroller: To process sensor data and control the movement. An automatic solar tracking system is an approach for optimizing the generation of solar power and modifying the angles and direction of a solar panel by considering changes in the position and path of the sun. This item can be returned in its original condition for a full refund or replacement within 30 days of receipt. We work hard to protect your security. Abstract: Solar energy is a promising renewable resource with vast potential for sustainable power generation. This project digs into the development of an Arduino-based solar tracker system that detects sunlight using Light Dependent Resistors (LDR) and changes the position of the solar panel using a servo. Solar trackers are advanced systems that enable solar panels to follow the sun's movement throughout the day, maximizing energy capture and improving overall system efficiency by 20-30%.
