

PIENAAR ENERGY (PTY) LTD

Solar photovoltaic panels have blue pollution

Overview

Solar energy technologies and power plants do not produce air pollution or greenhouse gases when operating. Using solar energy can have a positive, indirect effect on the environment when solar energy replaces or reduces the use of other energy sources that have larger effects on the environment. Photovoltaic (PV) electricity generation is essential for achieving decarbonization targets and mitigating climate change. Current forecasts call for more than 75 terawatts of PV to be deployed globally by 2050 —a more than tenfold increase in the current manufacturing and deployment rate in less. Solar energy, like any energy technology, has a life cycle that involves resource extraction, manufacturing, transportation, installation, operation, and eventual disposal, all of which can contribute to pollution. The production, operation, and disposal of solar panels contribute to pollution, water consumption, and hazardous waste accumulation, with an estimated 250,000 tons of solar waste reported in 2016 alone.

Solar photovoltaic panels have blue pollution

Unfounded concerns about photovoltaic module toxicity and waste are

Unsubstantiated claims that fuel growing public concern over the toxicity of photovoltaic modules and their waste are slowing their deployment.
