Overview

When a project developer builds a new electric generating facility or battery energy storage system (an energy facility), it must connect that facility to the electric or power grid to allow the produced electricity to be transmitted, distributed, and consumed by. When a project developer builds a new electric generating facility or battery energy storage system (an energy facility), it must connect that facility to the electric or power grid to allow the produced electricity to be transmitted, distributed, and consumed by. Sometimes energy storage is co-located with, or placed next to, a solar energy system, and sometimes the storage system stands alone, but in either configuration, it can help more effectively integrate solar into the energy landscape. What Is Energy Storage?

“Storage” refers to technologies that. Interconnection presents important issues and considerations for developers, whether the energy project involves new solar panels mounted to the roof of a home, a five megawatt (MW) community solar project, an 80 MW small power production qualifying facility, or a 600 MW natural gas generating. Centralized generation can be located far from areas of high population and feeds large amounts of electricity into the transmission lines. Transmission lines carry high voltage electricity from centralized power plants to a substation. This amount represents an almost 30% increase from 2024 when 48.6 GW of capacity was installed, the largest. Grid energy storage, also known as large-scale energy storage, is a set of technologies connected to the electrical power grid that store energy for later use.

Solar power generation must be connected to the grid through energy storage

Energy Storage Interconnection

Energy storage is expected to play an increasingly important role in the evolution of the power grid particularly to accommodate increasing penetration of intermittent renewable energy resources and ...

Solar, battery storage to lead new U.S. generating capacity additions

In 2025, capacity growth from battery storage could set a record as we expect 18.2 GW of utility-scale battery storage to be added to the grid. U.S. battery storage already achieved record growth in 2024 ...

Grid energy storage

Any electrical power grid must match electricity production to consumption, both of which vary significantly over time. Energy derived from solar and wind sources varies with the weather on time scales ranging from less than a second to weeks or longer. Nuclear power is less flexible than fossil fuels, meaning it cannot easily match the variations in demand. Thus, low-carbon electricity without storage presents special challenges to electric utilities.
