# Solar thermal power generation system composition diagram

 **LFP 12V 100Ah**

## Overview

---

The solar thermal power generation system consists of a heat collection part, a heat transmission part, a heat storage and heat exchange part, and a steam turbine power generation part. It uses a large-scale array of parabolic or dish-shaped mirrors to collect solar thermal energy, provides steam through a heat exchange device, and combines the technology of. Solar thermal power plants for electricity production include, at least, two main systems: the solar field and the power block. This fluid then transfers its heat to water, which then becomes superheated steam. This steam is then used to turn turbines in a power plant, and this mechanical energy is converted into electricity by a generator. The general strategy of energy conversion using solar thermal energy is presented on the diagram below.

## Solar thermal power generation system composition diagram

---

### Composition of solar thermal power generation system

A typical solar thermal power generation system is mainly composed of a concentrating and collecting subsystem, a heat transfer subsystem, a heat storage and heat exchange subsystem, ...
