Overview

While solar panels generate DC electricity, the grid operates using AC (alternating current) electricity. An inverter is needed to convert the electricity so that it can be used by the grid. For most of the past 100 years, electrical grids involved large-scale, centralized energy generation located far from. Each solar panel contains multiple photovoltaic (PV) cells that capture sunlight and convert it into DC (direct current) electricity. Small PV cells can power calculators, watches, and other small electronic devices. grid smoothly transition to renewable energy.
