The difference between JinkoSolar photovoltaic panels and ab grades

Overview

The core differences lie in three indicators: efficiency fluctuation value, EL imaging grade, and minority carrier lifetime. Taking the most common P-type monocrystalline as an example, Grade A modules require an efficiency standard deviation of $<0.3\%$, and EL imaging must reach Class 1. And once you've figured out what kind of solar panels, made of which material, you need to decide what grade to get. There's a lot to consider and figure. From 2020 Jinko's focus on the Tiger module means adopting the advanced technology of multi-busbar + Tiling Ribbon + half cut with the high-efficiency Jinko cell. There are 4 sub-series for Tiger modules that include: Max. This tech features a special round busbar, allowing more cells to be packed onto a single panel. Grade A panels, for instance, are the highest quality, while Grade D panels are typically considered low-grade materials with limited usability.

The difference between JinkoSolar photovoltaic panels and ab grade

Solar Panels Grades A, B, and C (Explained)

Grade A solar panels are entirely free of defects. Grade B has some visual flaws but still meets performance standards. Grade C has visual and performance deficiencies, and Grade D is ...
