

PIENAAR ENERGY (PTY) LTD

The function of the generator exhaust extension pipe

Overview

A generator exhaust extension is a pipe or duct that extends the generator's exhaust system away from the unit. To keep the generator safe outside, it is advisable to place it in a generator shed. The generator shed should be well-ventilated, and the exhaust should be positioned. The anatomy of a generator is very simple. It consists of an internal combustion engine (usually a four-stroke engine), an alternator (AC Electricity Generator), a fuel tank, starter, battery, radiator, control panel and a few other parts. That can lead to a much cleaner and safer work environment.
