Overview

To boost the power output of PV cells, they are connected together in chains to form larger units known as modules or panels. One or more arrays is then connected to the electrical grid as part of a. What is photovoltaic (PV) technology and how does it work?

PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different. The total amount of solar energy received on Earth is vastly more than the world's current and anticipated energy requirements. This process occurs when photons from sunlight strike a material, typically silicon, and displace electrons, generating a direct current (DC).
