Overview

At the heart of any solar power station lies its most iconic component: the solar panel. These sleek, glassy panels are responsible for capturing sunlight and transforming it into electricity through a process called the photovoltaic effect. Unlike rooftop solar systems used by households, these stations produce electricity on a much bigger scale—feeding it directly into. Power stations are large facilities designed to generate electricity.

A photovoltaic power station, also known as a solar park, solar farm, or solar power plant, is a large-scale grid-connected photovoltaic power system (PV system) designed for the supply of merchant power. They are different from most building-mounted and other decentralized solar power because they supply power at the utility level, rather than to a local user or users. Utility-scale solar is sometimes used to describe this ty...
