# The solar tracking system is slightly larger

BMS Wiring Diagram

## Overview

---

Short answer: The Solar System is a disc shape, 244 astronomical units wide (244 times the distance from the Sun to the Earth, or about 36. Long answer: There is some disagreement over exactly where the edge of the Solar System is, so there are disagreements over its. Scientists may have been overestimating the size of the solar system's biggest planet. New data from NASA's Juno spacecraft hint that Jupiter is a bit thinner and flatter than previously thought, although the updated numbers won't take away its record-holding title among its planetary peers. On this scale, the Sun, by far the largest thing in our solar system, is only a ball about two-thirds of an inch (17 millimeters) in diameter sitting on the goal line —. There are eight planets in the solar system. [11] The system formed about 4.

Overview Definition Formation and evolution General characteristics Sun Inner Solar System Outer Solar System Trans-Neptunian region

The Solar System is the gravitationally bound system of the Sun and the masses that orbit it, most prominently its eight planets, of which Earth is one. The system formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, creating the Sun and a

protoplanetary disc from which the orbiting bodies assembled. Inside the Sun's core hydrogen is fused into helium for billions of years, releasing energy which i...
