The world s superconducting magnetic energy storage system

Overview

This use of superconducting coils to store magnetic energy was invented by M. Superconducting magnetic energy storage (SMES) systems store energy in the magnetic field created by the flow of direct current in a superconducting coil that has been cryogenically cooled to a temperature below its superconducting critical temperature. It operates on a trio of principles: some materials can conduct electricity with absolutely no resistance, electric currents generate magnetic fields, and energy can be stored. SMES is an advanced energy storage technology that, at the highest level, stores energy similarly to a battery. External power charges the SMES system where it will be stored; when needed, that same power can be discharged and used externally. 6 tesla at a national experiment facility in Beijing.
