

PIENAAR ENERGY (PTY) LTD

Use life of photovoltaic panels for agricultural machinery

Overview

This report provides a detailed analysis of agrivoltaic systems, exploring their technical performance, modelling approaches, and operational challenges. Agrivoltaics combine the production of crops or livestock with the generation of electricity from solar panels. Vegetables and berries are the leading crops. Farmers can benefit from solar energy in several ways—by leasing farmland for solar; installing a solar system on a house, barn, or other building; or through agrivoltaics. By addressing these critical factors, it serves as a comprehensive guide to improving efficiency and ensuring transparent, replicable outcomes. Agrivoltaics, also known as agri-PV or dual-use solar, is an innovative land-use solution that co-locates solar photovoltaic (PV) panels with agricultural activities on the same land area. This practice transforms the traditional view of solar farms and crop fields as competitors into a synergistic. In its latest monthly column for pv magazine, IEA PVPS provides a comprehensive overview of the recently released edition of the “Dual Land Use for Agriculture and Solar Power Production: Overview and Performance of Agrivoltaic Systems” report. The 91-page handbook was developed by IEA PVPS Task.
