Wikipedia carbon dating

Overview

Radiocarbon dating (also referred to as carbon dating or carbon-14 dating) is a method for determining the age of an object containing organic material by using the properties of radiocarbon, a radioactive isotope of carbon. The method was developed in the late 1940s at the University of Chicago by Willard Libby. It is based on the fact that radiocarbon (^{14}C) is constantly being created in the Earth's background. In 1939, Libby began experiments to determine if any of the elements common in organic matter had isotopes with half-lives long enough to be of value in bio. The variation in the $^{14}\text{C}/^{12}\text{C}$ ratio in different parts of the carbon exchange reservoir means that a straightforward calculation of the age of a sample based on the amount of ^{14}C it contains will often give an incorrect result. Therefore, samples for dating need to be converted into a form suitable for measuring the ^{14}C content; this can mean conversion to gaseous, liquid, or solid form, depending on the measurement technique to be used. Before this.

Wikipedia carbon dating

What is Carbon-14 (14C) Dating? Carbon Dating ...

Radiocarbon dating is a method that provides objective age estimates for carbon-based materials that originated from living organisms.

[Get Price](#)

How Accurate Is Radiocarbon Dating?

Radiocarbon dating, often called carbon-14 dating, is a primary method for determining the age of organic materials in fields like archaeology, geology, and environmental science.

How Does Carbon Dating

Work?

Carbon dating is a technique used to learn the age of organic (that is, organism-derived) remains. It works in part by comparing the amount of carbon-14 with the amounts of the other carbon isotopes in ...
